

Add the SunSmart UV Alert to your website

Spring is here and UV levels in Victoria are starting to rise. Let people know when sun protection is required by placing a free SunSmart UV Alert widget on your website or intranet.

The widget provides:

- a daily reminder of the times that sun protection is required
- the maximum UV level for the day
- minimum and maximum temperatures
- general weather forecast information

UV cannot be seen or felt and can be damaging to the skin even on cool, cloudy days. As you cannot rely on temperature to know when to protect yourself from UV, it is important to get into the habit of checking the UV Alert every day.

To add the widget, a website administrator should follow the 'add this to your website' link at the bottom of the SunSmart UV Alert and copy and paste the information into your site.

For more information contact Dimity Gannon on 03 9635 5648
